No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

Sequence 6, Application US/08461002
Patent No. 6214543
GENERAL INFORMATION:
APPLICANT: Riley M.D., Lee W.
TITLE OF INVENTION: DNA Molecule Encoding for Cellular
TITLE OF INVENTION: Uptake of Mycobacterium Tuberculosis and Uses thereof
NUMBER OF SEQUENCES: 10
CORRESPONDENCE ADDRESS:
ADDRESSEE: Nixon, Hargrave, Devans & Doyle
STREET: Clinton Square, P.O. Box 1051
COUNTRY: U.S.A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

GENERAL INFORMATION:
APPLICANT: HOSHINO, Tatsuo
APPLICANT: HOSHINO, Tatsuo
APPLICANT: SETOGUCHI Yutaka
APPLICANTION: PROCESS FOR THE MANUFACTURE OF CAROTENOIDS AND BIOLOGICALLY USEFUI
TITLE OF INVENTION: MATERIALS THEREOF
FILE REFERENCE: C38435/111694
CURRENT FILING DATE: 2000-12-01
NUMBER OF SEQ ID NOS: 17
SEQ ID NO 9
LENGTH: 238
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  US-10-425-114-38355

Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0 Maximum DB seq length: 200000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

PIR\_79:\* Database :

1: pir1: \* 3: pir2: \* 4: pir3: \*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

| Sequence 14, Application US/08440391
| Patent No. 5656725
| GENERAL INFORMATION:
| APPLICANT: CHITTENDEN, Thomas D.; and APPLICANT: LUTZ, ROBER J.
| TITLE OF INVENTION: MODULATE APOPTOSIS
| TITLE OF INVENTION: MODULATE APOPTOSIS
| NUMBER OF SEQUENCES: 34
| CORRESPONDENCE ADDRESS:
| ADDRESSEE: Hale and Dorr | STREET: 1455 Pennsylvania Avenue, N.W. | CITY: Washington | STREET: 20004
| STAPE: 20004
| COMPUTER READABLE FORM: | MEDIUM TYPE: Floppy disk
                                                                                                                                                                                                                 PETUTION TILE

```
Bak protein - human

NiAlternate names: bcl-2 homolog; cdn-1 protein

C; Species: Homo sapiens (man)

C; Accession: S58873; S58874

R; Chittenden, T; Harrington, E.A.; O'Connor, R.; Flemington, C.; Lutz, R.J.; Evan, G.I., R; Chitten and T. A.; The sapient of apoptosis by the Bcl-2 homologue Bak.

A; Reference number: S58873; MUID: 95231653; PMID: 7715730

A; Recession: S58873; MUID: 95231653; PMID: 7715730

A; Residues: Dreliminary; nucleic acid sequence not shown

A; Molecule type: mRNA

A; Molecule type: mRNA

A; Residues: 1-21 CCHI.
